Experiment -10

Student Information System Using Zoho One (SaaS)

Aim

To create a simple cloud software application for a Student Information System using Zoho One as a cloud-based Software as a Service (SaaS) application.

Procedure

1. Log in to the Zoho One cloud platform using your credentials.

2. Open Zoho Creator from the list of applications.

3. Create a new application named Student Information System using a pre-designed template.

4. Select an appropriate template and customize it according to the requirements of the student information system.

5. Open the form and add or modify fields to include the following student details:

- Student Name
- Register Number
- Address
- Phone Number
- Age
- Course
- Grades
- Attendance Report
- Progress Report
- Semester Mark Sheet

6. Configure the field types appropriately by using text fields for student name, register number, address, and course; a phone field for phone number; a number field for age; dropdowns for grades; and percentage, multiline text, or file-upload fields for attendance reports, progress reports, and semester mark sheets.

7. Customize the form layout by arranging the fields properly and making essential fields mandatory.

8. Save the changes and publish the customized Student Information System application so that authorized users can access it through a web browser.

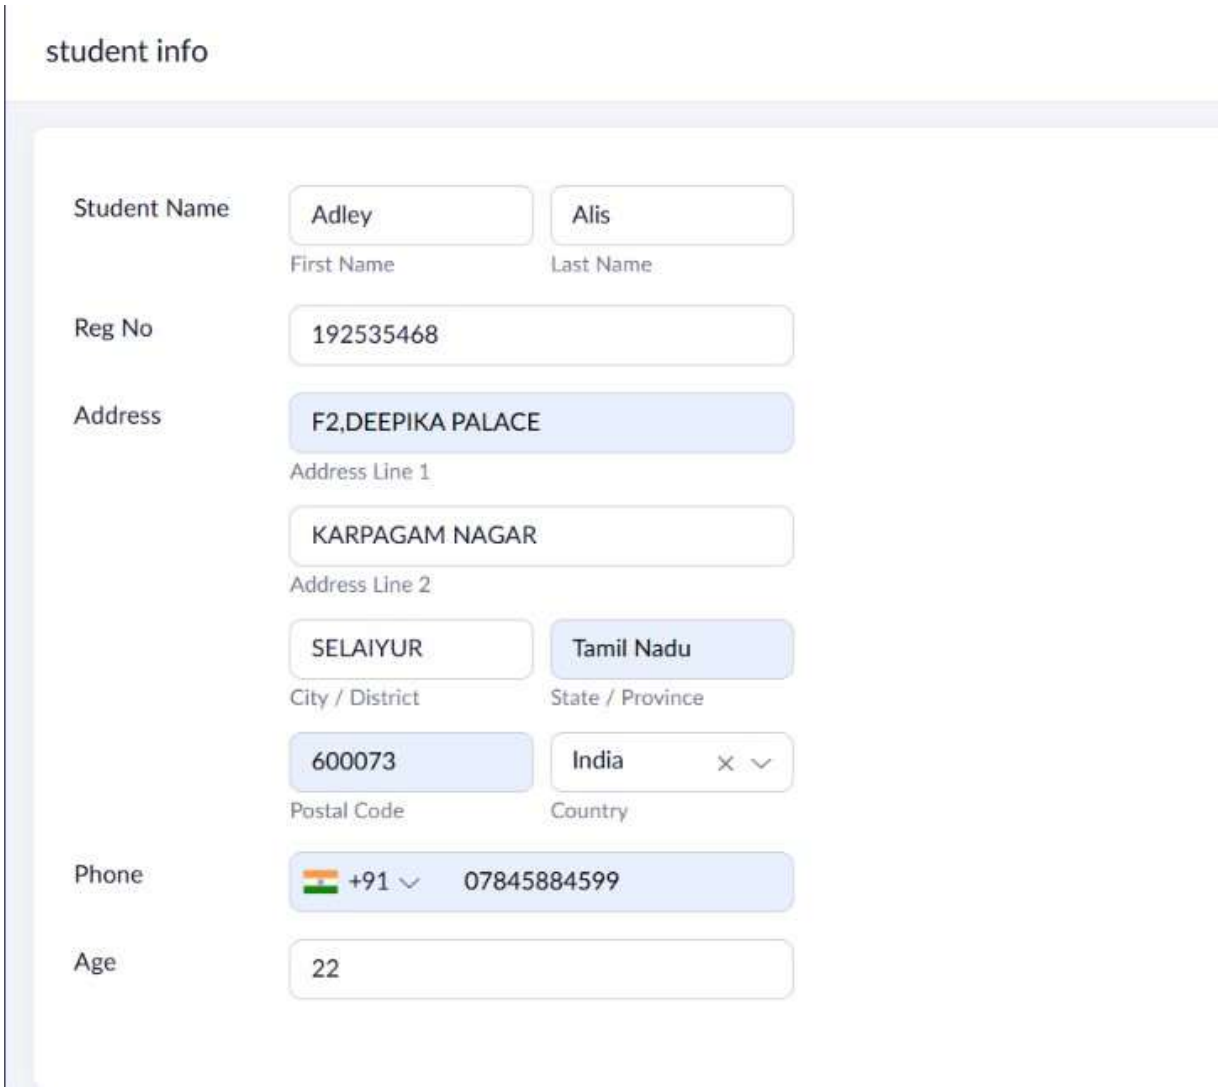

9. Enter sample student details into the form, such as student name, register number, address, phone number, age, course, grades, and attendance details.

10. Submit the form and verify that the entered student details are stored correctly in the cloud database.

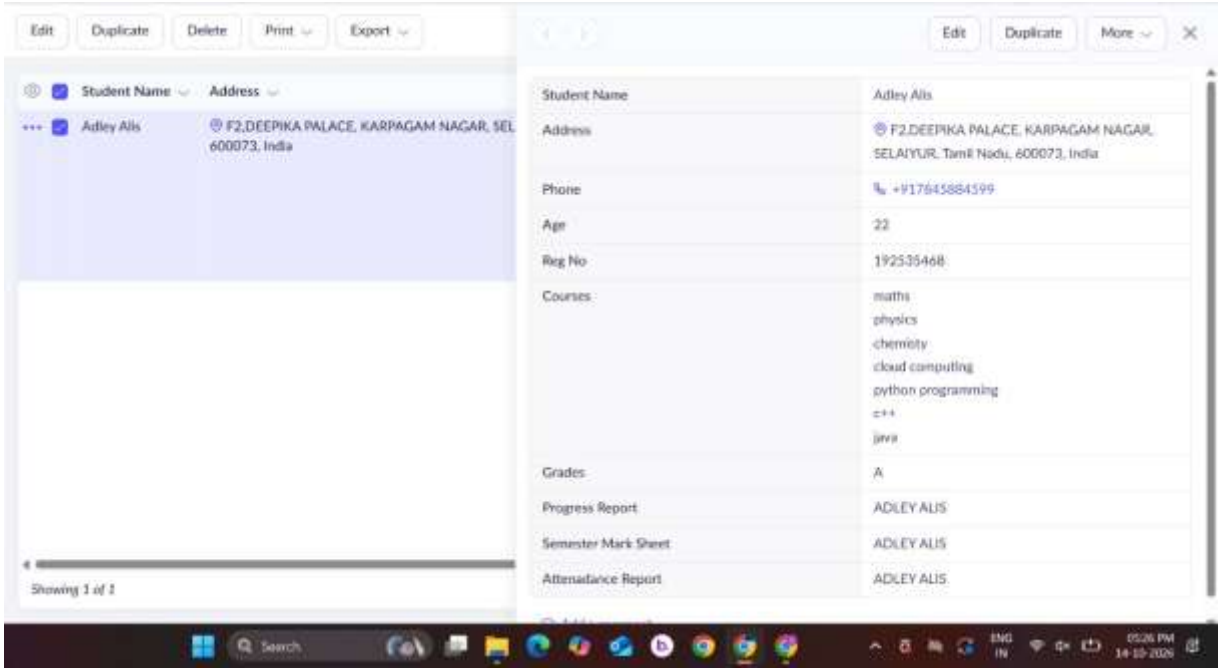

11. Open the records section to view student details, attendance reports, progress reports, and semester mark sheets. Test the application with different student records.

12. Verify that the Student Information System works successfully as a SaaS application by allowing authorized users to enter, store, and view student information through the cloud platform.

Implementation Input:

Output:

Result

Thus, a Hospital Information System for SIMATS Hospital was successfully created using Zoho One and demonstrated as a Software as a Service (SaaS) application.
