Experiment -11

Online Supermarket System Using Zoho One (SaaS)

Aim

To create a simple cloud software application for an Online Supermarket using Zoho One as a cloud-based Software as a Service (SaaS) application, including customer details, product information, and an item classification form.

Procedure

1. Log in to the Zoho One cloud platform using your credentials.

2. Open Zoho Creator from the list of applications.

3. Create a new application named Online Supermarket System using a pre-designed template.

4. Select an appropriate template and customize it according to the requirements of the online supermarket.

5. Open the customer order form and add or modify fields to include the following details:

- Customer Name
- Address
- Phone Number
- Email ID
- Item Name
- Item Classification
- Quantity
- Unit Price
- Total Amount
- Order Date
- Payment Method
- Order Status

6. Configure the field types appropriately by using text fields for customer name, address, and item name; a phone field for phone number; an email field for email ID; dropdowns for item classification and payment method; number fields for quantity and unit price; and a date field for order date.

7. Create a separate Item Classification Form to categorize supermarket products into the following groups:

- Fruits and Vegetables
- Dairy Products
- Bakery Products
- Beverages
- Snacks and Packaged Foods

- Household Items
- Personal Care Products
- Grains and Pulses

8. Customize the form layout by arranging the fields properly and making essential fields mandatory. Configure the total amount using the formula:

Total Amount = Quantity × Unit Price

9. Save the changes and publish the customized application so that authorized users can access it through a web browser.

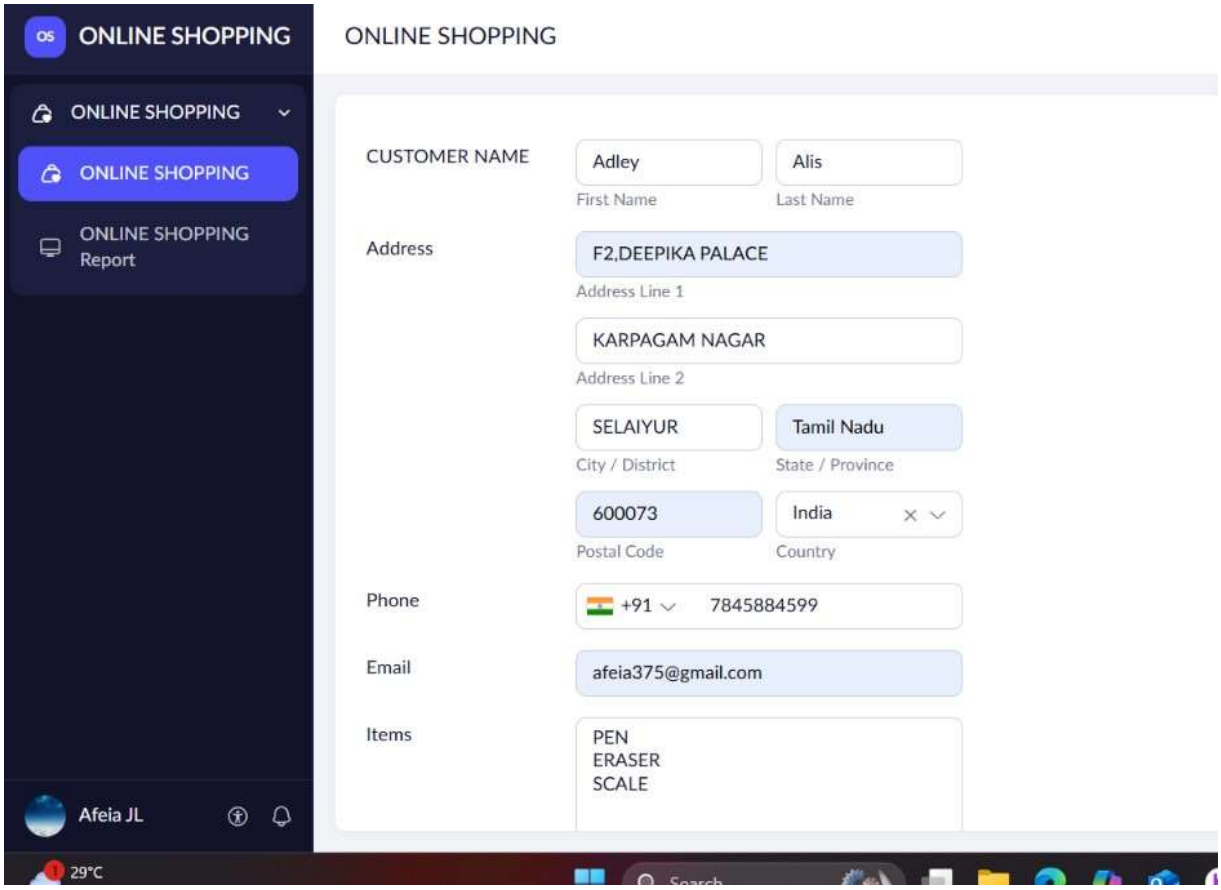

10. Enter sample customer and order details into the form, including the customer's name, address, item name, classification, quantity, and unit price.

11. Submit the form and verify that the customer and order details are stored correctly in the cloud database.

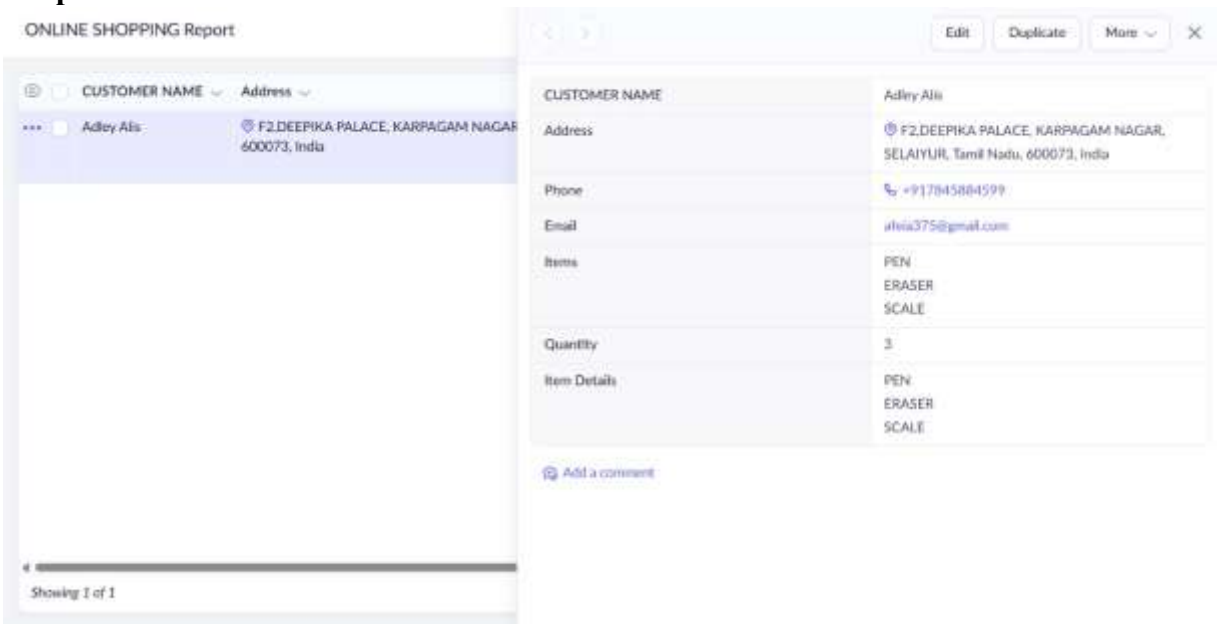

12. Open the records section to view customer orders and item classifications. Test the application with different products, quantities, and classifications.

13. Verify that the Online Supermarket System works successfully as a SaaS application by allowing users to enter, store, and view customer orders through the cloud platform.

Implementation Input:

Output:

Result

Thus, an Online Supermarket System was successfully created using Zoho One and demonstrated as a Software as a Service (SaaS) application with customer order management and an item classification form.
