Experiment -12

Installation of Type-2 Hypervisor and Creation of a Virtual Machine

Aim

To demonstrate virtualization by installing a Type-2 hypervisor and creating and configuring a virtual machine.

Procedure

1. Download and install VMware Workstation on the Windows host operating system.

2. Open VMware Workstation and select File → New Virtual Machine.

3. Select Typical (recommended) and click Next.

4. Choose the Ubuntu ISO image or select the option to install the operating system later.

5. Select Linux as the guest operating system and Ubuntu as the version.

6. Enter the virtual machine name as Ubuntu and specify the location to store the virtual machine files.

7. Configure the virtual machine with 1 processor, 2 GB RAM, and a 15 GB virtual hard disk.

8. Configure the virtual hard disk by specifying the maximum storage capacity and selecting the required disk storage option.

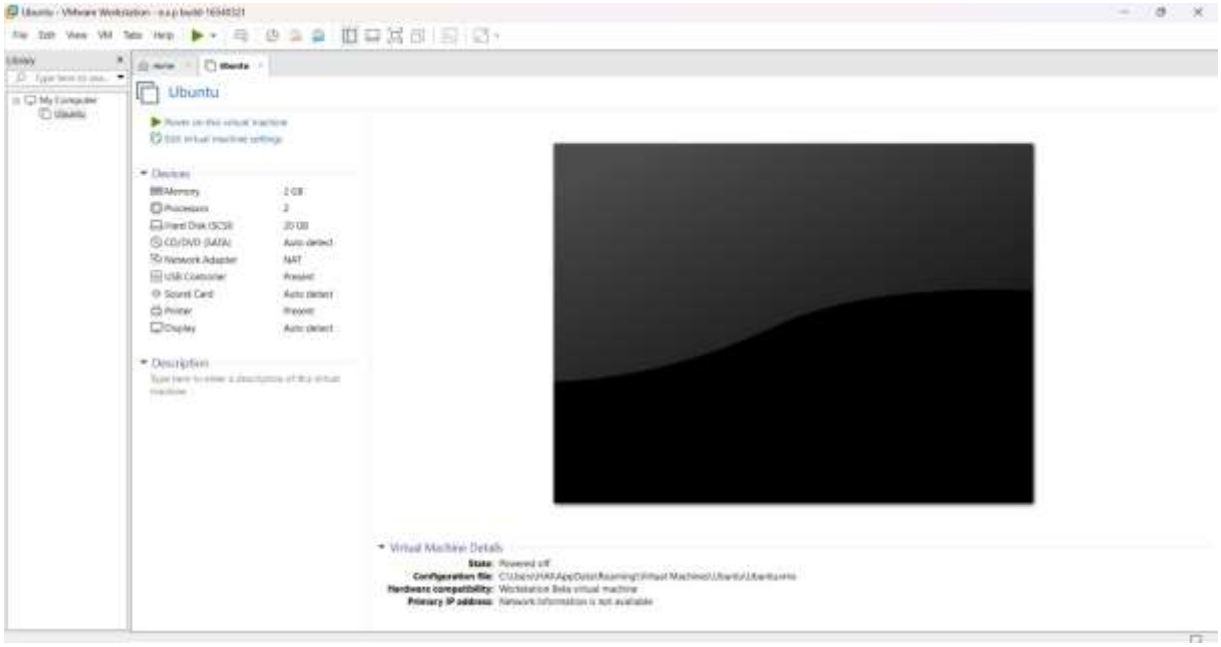

9. Configure the network adapter using NAT to enable network access through the host system.

10. Review the configuration and click Finish to create the virtual machine.

11. Power on the virtual machine and install Ubuntu by following the on-screen instructions.

12. After installation, restart the virtual machine and verify that Ubuntu runs successfully inside VMware Workstation.

Output:

Result

Thus, virtualization was successfully demonstrated by installing VMware Workstation, a Type-2 hypervisor, and creating and configuring a virtual machine with Ubuntu Linux as the guest operating system on a Windows host.
