Experiment -13

Creation and Configuration of a Virtual Machine Using a Type-2 Hypervisor

Aim

To create a virtual machine using Type-2 virtualization software with 1 CPU, 2 GB RAM, and a 15 GB virtual hard disk.

Procedure

1. Open VMware Workstation on the Windows host operating system.

2. Select File → New Virtual Machine.

3. Choose Typical (recommended) and click Next.

4. Select an Ubuntu ISO image or choose to install the operating system later.

5. Select Linux as the guest operating system and Ubuntu as the version.

6. Enter the virtual machine name as Ubuntu-VM and specify the location to store the virtual machine files.

7. Set the maximum virtual hard disk size to 15 GB.

8. Choose Store virtual disk as a single file or Split virtual disk into multiple files, then click Next.

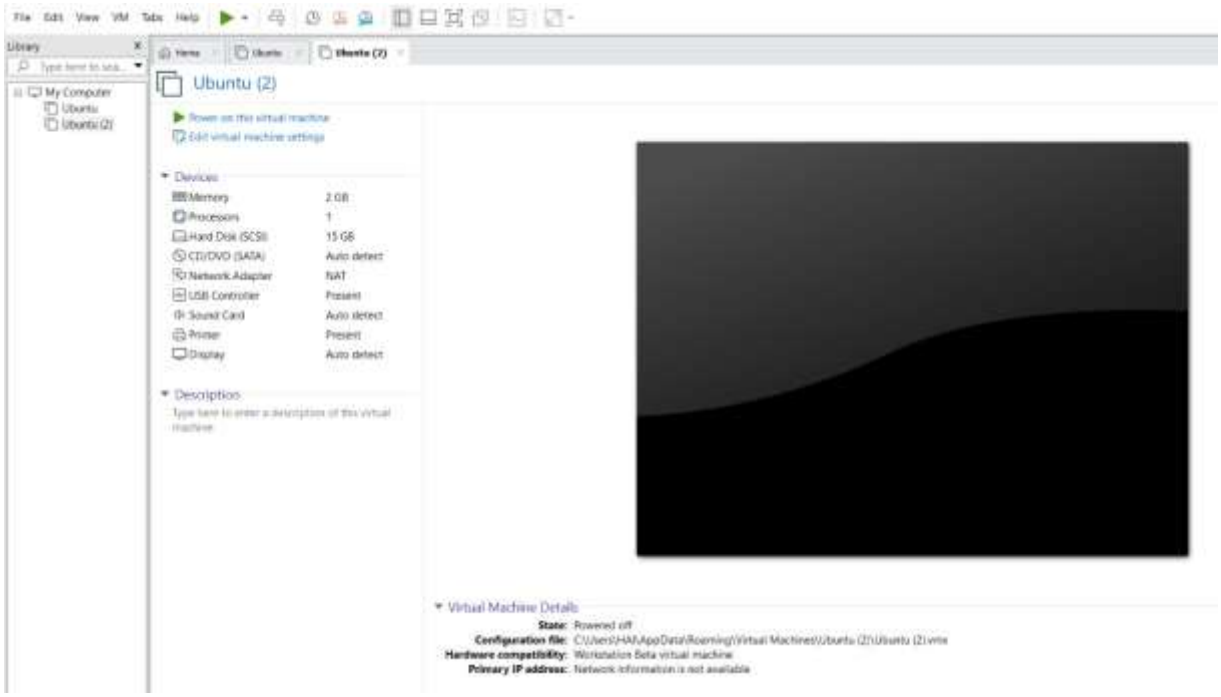

9. Click Customize Hardware and set the memory to 2048 MB (2 GB).

10. Set the number of processors to 1 and verify the other hardware settings.

11. Click Close, then Finish to create the virtual machine.

12. Power on the virtual machine and install Ubuntu if an ISO image was selected. Verify that the virtual machine starts successfully.

Output:

Result

Thus, a virtual machine was created and configured using VMware Workstation, a Type-2 hypervisor, with 1 CPU, 2 GB RAM, and a 15 GB virtual hard disk.
